You never said goodbye
Author Unknown

You never said I’m leaving,
You never said goodbye,
You were gone before I knew it,
And only God knew why.

A million times I needed you,
A million times I cried.
If love alone could have saved you,
You never would have died.

In life I loved you dearly,
In death I love you still.
In my heart you hold a place,
That no one could ever fill.

It broke my heart to lose you,
But you didn’t go alone.
For part of me went with you,
The day God took you home.

Kyle Thomas
December 10, 1992-May 29, 2017

Love, Dad
Copy of 2018 Annual Drinking Water Quality Report

Is my water safe?

We are pleased to present the 2018 Annual Water Quality Report (Consumer Confidence Report) as required by the Safe Drinking Water Act (SDWA). The Water Quality Report is an important public document that allows the public to understand what is in your drinking water and how the water utility ensures that it meets water quality standards at their source.

Do we need to take special precautions on tap water?

Some people may be more vulnerable to contaminants in drinking water than the general population. Infants, persons with certain chronic diseases, and immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, and persons who have immune system deficiencies, some elderly, and infants under six months of age may be particularly at risk from infections. These groups should seek advice about drinking water before their babiesiere smaller amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water is unsafe to drink or that the water utility is violating any water quality standards. Information Network (IWAN) does not determine the level of risk to consumers. Information Network (IWAN) does not determine the level of risk to consumers.

Where does my water come from?

Our water comes from the Lower Provo River and the Ogden River.

Source water assessment and vulnerability

Our source water assessment has been completed. Our wells are located in LINOW and are vulnerable to contamination. For a copy of the report, please contact us at (801) 999-4751.

How can I get involved?

We encourage our customers to be informed about their water utility. For additional information, contact our office at 801-280-5500.

Description of Water Treatment Process

Your water is treated at a "treatment train" of processes intended to remove contaminants that include turbidity, disinfection, fluoride, iron, and manganese. Disinfection methods and dosage rates are adjusted in the source water to minimize chemical oxidant demand that can affect the taste and odor of the water. Disinfection by-products are monitored to ensure compliance with regulations. The water is also monitored for other contaminants such as organic compounds, bacteria, and inorganic compounds. The treated water is then monitored for compliance with regulations. The water is then distributed to the customers through the distribution system.

Water Conservation

Did you know that the average U.S. household uses approximately 400 gallons of water per day? That's the equivalent of a 100-gallon-per-day water-use efficiency. If you can save 100 gallons of water, you can save $1000 a year on your water bill.

Prevention of drinking water is everyone's responsibility. You can help protect your community's drinking water source in several ways:

1. Reduce crop and garden water use: Consider using water-efficient irrigation systems and plants.
2. Fix leaky faucets and toilets: These can waste a significant amount of water.
3. Use reusable water bottles and refill them when you run out.
4. Take shorter showers: A five-minute shower uses 5 to 6 gallons of water, compared to 10 to 15 gallons of water.
5. Turn off the faucet while washing dishes.

Undetected Contaminants

The following contaminants were not detected but may be present, if:

Water Quality Data Table

In order to ensure that your water is safe to drink, EPA prescribes regulations which limit the amount of contaminants to which your water may be exposed. This table below reflects all of the drinking water contaminants that we measured during the calendar year of 2018. Although many contaminants cannot be detected routinely, they are included in this table for information purposes. The results of drinking water sources are categorized into several groups: (1) microbial contaminants, (2) inorganic contaminants, and (3) organic contaminants. Each group contains certain naturally occurring contaminants. At low levels, these substances are present in most drinking water supplies. Categorical summaries are provided to give you an overview of the sources of drinking water and the potential health effects of these contaminants. The table is created from the latest data available from the Environmental Protection Agency (EPA). The data is reported in units of parts per million (ppm) or parts per billion (ppb).

Water Quality Data Table

<tr>
<td>ppb</td>
<td>parts per billion</td>
<td></td>
</tr>
</tbody>
</table>

Other Information

To comply with the “Regulatory Gating Fundamentals Community Water Supply” (RGWFS), it is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which fluoridated supplies were studied within the community of Ogden was 11. The mean concentration of fluoride samples calculated in the previous calendar year was 0.7 ppm.

Additional Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead is a concern in drinking water primarily from materials and components associated with service lines and home plumbing. In City of Ogden Water Department is responsible for providing high quality drinking water but cannot control the variety of materials used in homes and buildings by previous owners. If your water has been in storage for several hours, you may wish to flush the system by turning on the cold water faucets for several minutes to flush lead out of the pipes. This may not be a good choice for water sources that have had lead or copper exposure. Because lead is a toxic substance, especially for pregnant women and young children, lead is a concern in drinking water primarily from materials and components associated with service lines and home plumbing. It is not possible to predict the amount of lead in water from service lines and home plumbing. In the absence of the results of testing, the Consumer Confidence Report contains the results of the last water system test. The results of the last water system test are generally not harmful but can be harmful to people who have certain medical conditions. Daily intake of lead in drinking water from service lines and home plumbing can be harmful to people with certain medical conditions. Daily intake of lead in drinking water from service lines and home plumbing can be harmful to people with certain medical conditions. Daily intake of lead in drinking water from service lines and home plumbing can be harmful to people with certain medical conditions.
